BioCosmetic®-archwires – durable, perfect aesthetics.

BioCosmetic®-archwires are the first tooth-coloured archwires that remain constantly white and therefore enable long-term aesthetical treatment. They also provide maximum intraoral comfort for the patient, as the white coating covers superelastic NiTi archwires. These Archwires ensure gentle forces and quick treatment due to their extremely low force level.

The time required for changing a BioCosmetic®-archwire is the same as that for uncoated archwires. Even the use of self-ligating brackets, which generally allow longer intervals for archwire changes, does not present a problem for BioCosmetic®-archwires. Their tooth-coloured coating remains intact ensuring perfectly maintained aesthetics. Regardless of whether the bracket slots are made of metal or ceramic, BioCosmetic®-archwires maintain their white coating without any problem for six to eight

weeks. In addition we recommend to use patient friendly brackets with rounded bracket and slot edges as for example the QuicKlear® bracket by FORESTADENT. BioCosmetic®-archwires, however, should not be adapted or bent, as sharp objects may damage the white coating.

FORESTADENT®
GERMAN PRECISION IN ORTHODONTICS

The intelligent archwire for every treatment stage

BioStarter®: Round archwires for a perfect start to your orthodontic treatment

BioTorque®: Square and Rectangular archwires for efficiency

when you need to express detail

BioLingual®: Round archwire for intelligent lingual treatment

BioCosmetic®: Durable, perfect aesthetics

The correct force for each treatment phase.

In orthodontics, just like in car racing, the correct application of force and torque is crucial: too much of either and you will get unwanted side effects, too little and nothing happens at all. Archwires are the engine of orthodontic tooth movement. During each treatment phase the correct choice of archwire should guarantee the correct force application. You will reach your treatment goals faster without unwanted side effects. When using BioArchwires from FORESTADENT you can choose the correct force levels for any stage of your treatment.

Faster treatment progress due to efficient force application.

The uniquely smooth surface of BioArchwires reduces the friction between archwire and bracket by up to 30 %. Due to the combination of the unique characteristics these intelligent wires from FORESTADENT work more gently and efficiently. The orthodontic treatment will be completed faster. When using BioArchwires treatment can be completed with fewer archwires in a shorter period of time – a more economical solution for the clinician and the patient.

Restoring force

The uniquely smooth surface of BioStarter® and BioTorque® archwires reduces friction and allows faster and more efficient treatment progress.

BioStarter® round 0.010" – for particularly sensitive patients

The smallest BioStarter® archwire with the dimension 0.010" broadens the application of BioStarter® archwires even further. This archwire will work in the most adverse conditions, e.g. periodontally compromised patient and malocclusion can be corrected with the lightest of forces totally risk free and extremely gentle. Until now stranded wires with high friction and poor elasticity had to be used for these applications leading to extended treatment times. The BioStarter® archwire is also suitable on sensitive and anxious patients.

BioTorque® square and rectangular wires – efficiency for all dimensions

Torquing generates a high degree of bone absorption and reformation. During this process high forces are expressed on teeth which can have a damaging effect on the dentition. The new thermoactive BioTorque® archwires from FORESTADENT are extremely gentle and can help to reduce long term damage. Due to the extremely precise dimensions of the FORESTADENT wires exact torquing is a lot easier. BioTorque® archwires feature the same unique surface finish as the BioStarter® archwires helping to keep friction to a minimum. Together with the extreme superelasticity BioTorque® archwires work very efficiently and super fast. BioTorque® archwires can be used in extremely difficult cases without any risk, e.g. sensitive or compromised patients.

BioLingual® round archwire for intelligent lingual treatment

Thermoactive bioarchwires are not only available for the vestibular treatment of teeth but also for lingual treatment. The BioLingual® archwires are mushroom shaped and can be ordered in six different forms with four dimensions each (.010", .012", .014", und .016"). Over 200 jaws were digitally recorded for determining the optimal shapes, which provided the basis for calculating the respective arch shapes. The nickel-titanium BioLingual® archwires generate their optimal force at body temperature, in the same way as the popular BioStarter® and BioTorque® archwires.

What are you waiting for?

It's time for a change. Order your BioStarter®, BioTorque® and BioLingual® wires today and change to the intelligent and patientfriendly technology from FORESTADENT. FORESTADENT technology - for you and your patients benefit.

River Finish Gold

Over 111 years of working with surface polishing is ideal for creating the optimum arch wires. Inspired by the smooth surface of river stones, FORESTADENT archwires undergo a unique treatment process called River Finish Gold. The result is ultra-smooth archwires with low friction. The best possible foundation for a perfect treatment result.
